

Incident Lifecycle Automation in ServiceNow

PHASE 6: REASSIGNMENT & ESCALATION

Objective

The purpose of Phase 6 is to ensure that incidents are assigned to the correct support group and that assignment changes are handled properly. This phase validates reassignment and confirms that the assignment group is updated while the incident remains consistent and traceable.

Description

- 1 Update the Assignment group to: **Network**.
- 2 Verify that the Assigned to field clears automatically when the assignment group changes, if required by the configured workflow.
- 3 Review the incident to confirm that the new assignment group is correct.
- 4 Check the Watch List Update activity and ensure the relevant incident information is maintained.
- 5 Save the incident record.
- 6 Verify that the incident is now available to the appropriate Network support team for further action.

Reassignment Process

When an incident is determined to belong to another support team, the Assignment group is changed to the appropriate group. In this scenario, the incident is reassigned to the Network group. The system may automatically clear the Assigned to value so that a suitable technician from the new group can be selected.

Watch List Update

The Watch List allows additional users or support members to receive updates about the incident. Updating the watch list helps maintain communication and visibility during reassignment and escalation.

Expected Result

The incident is successfully reassigned to the Network assignment group. The Assigned to field is cleared when applicable, the incident remains properly tracked, and the correct support team can continue the resolution process.

Phase 6 Outcome

This phase demonstrates controlled incident reassignment and escalation in ServiceNow. It ensures that incidents reach the correct support team without losing important incident details or

tracking information.
