

Incident Lifecycle Automation in ServiceNow

PHASE 10 – INCIDENT RESOLUTION

1. Phase Overview

Phase 10 focuses on completing the incident lifecycle by documenting the resolution, recording the workaround used, and formally resolving the incident. This ensures that the corrective action is captured clearly and the incident is moved to its final resolved state.

2. Steps Performed

1. Open the incident and navigate to the Resolution section.
2. Add the resolution details for the incident.
3. Set **Resolution Code** to: **Workaround provided**.
4. Enter the resolution notes: **Restarted VPN-SRV-02 service as per emergency change request**.
5. Save the resolution details.
6. Click **Resolve** to complete the incident.
7. Confirm the resolution popup by selecting **Resolve**.

3. Additional Points for Documentation

- The resolution information provides a clear record of the action taken to restore the affected VPN service.
- The workaround-based resolution code indicates that service was restored using an operational workaround rather than a permanent root-cause fix.
- The resolution notes link the incident action to the emergency change request, improving traceability and auditability.
- Saving the resolution before resolving the incident ensures that the final incident record contains complete closure information.
- The Resolve action formally completes the incident lifecycle and prevents the record from remaining in an active state.
- A properly documented resolution helps support future troubleshooting, reporting, knowledge creation, and incident analysis.

4. Expected Result

The incident is successfully resolved with the resolution code and resolution notes saved. The final record clearly shows how the VPN service issue was addressed and provides traceability to the emergency change performed.

5. Phase Outcome

Item	Outcome
Resolution Code	Workaround provided
Resolution Notes	VPN-SRV-02 service restarted as per emergency change request

Incident Status	Resolved
Lifecycle Stage	Incident closure completed
