

Incident Lifecycle Automation in ServiceNow

PHASE 11 – KNOWLEDGE CREATION

1. Phase Overview

Phase 11 focuses on converting the incident resolution information into a reusable Knowledge article. This helps support teams document the solution and makes the information available for handling similar incidents in the future.

2. Steps Performed

1. Click **Create Knowledge** from the incident record.
2. Select **IT as Knowledge Base**.
3. Select the article template as **Standard** and click **Next**.
4. Verify all the required details and click **Save**.
5. Go back to the **Parent Record**.
6. Open **Related Records** and verify that the Knowledge article has been created.

3. Additional Points for Documentation

- The incident solution is converted into structured knowledge so that the same troubleshooting information can be reused.
- Selecting the IT Knowledge Base ensures that the article is stored in the appropriate knowledge repository.
- The Standard template provides a consistent format for documenting incident solutions.
- Verifying the article before saving helps ensure that important incident and resolution information is captured correctly.
- The Related Records section provides traceability between the original incident and the newly created Knowledge article.
- Knowledge creation reduces repeated troubleshooting effort and supports faster resolution of similar VPN-related incidents.
- The created article can become a reference for service desk and support teams during future incidents.

4. Expected Result

A Knowledge article is successfully created from the incident and stored in the IT Knowledge Base using the Standard template. The created article is visible from the parent incident's Related Records section.

5. Phase Outcome

Item	Outcome
Knowledge Base	IT
Article Template	Standard

Knowledge Creation	Completed
Verification	Created article visible in Related Records
