

Incident Lifecycle Automation in ServiceNow

PHASE 12 – FINAL VALIDATION

1. Phase Overview

Phase 12 focuses on the final validation of the complete incident lifecycle. All related records, incident states, resolution details, change information, knowledge creation, and SLA tracking are checked to confirm that the workflow has been completed correctly and consistently.

2. Final Validation Checks

1. Verify that the **Parent Incident** is in the **Resolved** state.
2. Verify that the related **Child Incident** is also in the **Resolved** state.
3. Check the **Activity** section to confirm that the resolution was triggered by the parent incident where applicable.
4. Verify that the required **Change Request** is linked to the incident.
5. Confirm that the required **Knowledge Article** has been created and is available in the related records.
6. Verify that **SLA tracking** information is visible and recorded correctly.
7. Review the incident fields, classification, assignment, resolution notes, and related records for completeness.
8. Confirm that no required task or supporting record remains incomplete before final project validation.

3. Additional Points for Documentation

- Final validation ensures that all phases of the incident lifecycle work together as expected.
- The parent and child incident relationship is verified to ensure proper synchronization and closure.
- Linked change and knowledge records provide traceability and support future troubleshooting.
- SLA visibility confirms that service-level tracking was maintained throughout the incident process.
- Reviewing all fields before completion helps identify missing or inconsistent information.
- Successful validation confirms that the incident is ready for final project sign-off and demonstration.
- The validation results provide evidence that the implemented ServiceNow workflow meets the defined project requirements.

4. Expected Result

All incident lifecycle records and related activities are verified successfully. The parent and child incidents are resolved, the change request and knowledge article are linked or available as expected, and SLA tracking is visible. The complete workflow is therefore validated and ready for final review.

5. Phase Outcome

Validation Area	Expected Outcome
Parent Incident	Resolved

Child Incident	Resolved
Resolution Activity	Verified
Change Request	Linked
Knowledge Article	Created and verified
SLA Tracking	Visible and verified
Overall Workflow	Successfully validated
