

Incident Lifecycle Automation in ServiceNow

Phase 8: Emergency Change Request Creation

Purpose: This phase handles an incident that requires an infrastructure change before the issue can be resolved. The incident is linked to the change process to maintain proper control, approval, and traceability.

Steps and Additional Points

- Update the Configuration Item from **ThinkStation** to **PowerEdge** as required by the investigation.
- Save the updated incident information so that the latest infrastructure details are recorded.
- Return to the incident record and update the **State** to **On Hold** because resolution depends on a pending change.
- Set the **On Hold Reason** to **Awaiting Change** to clearly indicate why incident work is temporarily paused.
- Create or associate a change request when an infrastructure modification is required to resolve the VPN-related issue.
- Linking the incident with the change provides complete traceability between the reported issue and the technical modification.
- The change follows the organization's change-management process, helping ensure that modifications are reviewed and performed in a controlled manner.
- After the change is completed, the incident can be resumed and the solution can be validated before moving toward final resolution.
- This process improves accountability, reduces the risk of unauthorized changes, and maintains a clear history of actions taken during incident resolution.

Outcome

The incident is correctly placed on hold while awaiting the required change. The configuration item and incident status are updated, and the change activity remains traceable to the original incident. Once the change is completed and verified, the incident can continue through the resolution process.
